

Living Shorelines

The Responsible Way to Protect Our Coast

Living shorelines are an environmentally superior alternative to hardened bulkheads and seawalls. Hardened structures have failed for years to protect our homes and businesses from storms. Living shorelines are a more effective and environmentally sound solution.

Living shorelines are built from natural materials, integrate with the landscape and will survive even the hardest blow.

A living shoreline on your property can:

- Reduce wave energy and erosion
- Restore habitat for plants and animals
- Avoid permits for hard structures
- Increase resilience to storms
- Trap sediment to stabilize and reclaim your waterfront
- Improve water quality by filtering pollutants
- Beautify your investment
